

ALE 25. Units of Concentration(Reference: 13.5 Silberberg 5th edition)***How do you convert from one unit of concentration to another?***

Your Goal: to be able to convert from one unit of concentration in the model below to any other unit of concentration in the model using dimensional analysis (factor-label method) to show your work.

1. The first step in achieving this goal is to *memorize* each unit of concentration in the model below...

The Model: Units of Concentration

Unit of Concentration	Ratio	Major Uses
Molarity (<i>M</i>)	$\frac{(\text{mol}) \text{ of solute}}{\text{volume (L) of solution}}$	Stoichiometric calculations involving solutions since $V(\text{L}) \times M = \text{mol solute}$
Molality (<i>m</i>)	$\frac{(\text{mol}) \text{ of solute}}{\text{mass (kg) of solvent}}$	Does not change with temp. \therefore used in BP elevation and FP depression calculations
Parts by mass (mass fraction)	$\frac{\text{mass of solute}}{\text{mass of solution}} = \text{mass fraction}$	Commonly used in the biological, medical and environmental sciences. ppm and ppb are used when solute concentration is very low.
Parts per million (ppm)	$(\text{mass fraction}) \times 10^6$	
Parts per billion (ppb)	$(\text{mass fraction}) \times 10^9$	
Mass % (% w/w or % m/m)	$(\text{mass fraction}) \times 100$	
Volume % (% v/v)	$\left(\frac{\text{volume of solute}}{\text{volume of solution}} \right) \times 100$	
Mass/Volume % (% m/v)	$\left(\frac{\text{mass of solute}}{\text{volume of solution}} \right) \times 100$	
Mole fraction (<i>X</i>)	$\frac{(\text{mol}) \text{ of solute}}{(\text{mol}) \text{ of solute} + (\text{mol}) \text{ of solvent}}$	Used in Raolt's Law Calculations when finding the vapor pressure of a solution

2. Your task now is to practice applying using these units of concentration. Consider the following questions when solving problems involving conversion of one unit of concentration to another:
- What are the units of concentration given in the problem?
 - What are the units you are converting to?
 - What is (are) the conversion factor(s) needed to get the desired unit of concentration?
 - Set up the problems using dimensional analysis. Units should cancel to give the units desired.

3. Useful Conversion Factors

To convert between...	Conversion factor	Units of conversion factor
<i>moles of a substance and its mass</i>	molar mass or molecular weight	g / 1 mol
<i>mass of a substance and its volume</i>	density, d	g / 1 mL or g / 1 L (for gases)
<i>moles of solute to volume of solution</i>	Molarity, M	mol solute / 1 L solution
<i>moles of solute to kg solvent</i>	molality, m	mol solute / 1 kg solvent

Exercises

Use dimensional analysis (factor-label method) and correct significant figures to solve the following problems. Circle your answer for each question.

1. Calculate the molarity of a solution made by diluting 25.0 mL of 6.15 M HCl to a volume of 0.500 L with water. Circle your answer.

2. How would you prepare 3.5 L of 0.55 M NaCl from solid NaCl? Circle your answer.

3. Calculate molality of a solution containing 164 g of HCl in 753g of water. Circle your answer.

4. Calculate the molality of a solution consisting of 2.77 mL of carbon tetrachloride (CCl_4 , $d = 1.59$ g/mL) in 79.5 mL of methylene chloride (CH_2Cl_2 , $d = 1.33$ g/mL) Circle your answer.

5. A 28.8 mass % aqueous solution of iron (III) chloride has a density of 1.280 g/mL.
- Calculate the molality of the solution. Circle your answer.

 - Calculate the molarity of the solution. Circle your answer.

 - Calculate the mole fraction of FeCl_3 . Circle your answer.
- 6.a. How many grams of solid NaOH are needed to prepare 250.0g of 1.00% (w/w) NaOH in water? Circle your answer.
-
-
-
-
-
-
-
-
-
-
- How many grams of water are needed? Circle your answer.
-
-
-
-
-
-
-
-
-
-
- How many mL of water at 20.0 °C are needed? (d_{water} at 20.0 °C = 0.9882 g/mL) Circle your answer.
-
-
-
-
-
-
-
-
-
-
- What is the molality of the solution? Circle your answer.

- 6e.) What is the approximate freezing point of the solution? (K_f for water = $1.86\text{ }^\circ\text{C/m}$) Circle your answer.
- 7a. Concentrated hydrochloric acid purchased from chemical supply houses is 37% HCl by mass. What mass in grams of conc. HCl is needed to make 1.0 liter of 0.10 M HCl? Circle your answer.
- b.) How would you make the 0.1 M HCl solution? Circle your answer.
8. Calculate the molality 2.00 % NaCl (w/w). (NaCl = 58.4425 g/mol) Circle your answer.
9. Conc. hydrobromic acid can be purchased as 40.0% HBr by mass. The density of the solution is 1.38 g/mL. What is the molar concentration of 40.0% HBr? (HBr = 80.912 g/mol) Circle your answer.

Recall Raoult's Law from the last ALE...

Raoult's Law

$$P_{\text{soln}} = (X_{\text{solvent}})(P^{\circ}_{\text{solvent}})$$

Where...

P_{soln} = Vapor Pressure of Solution

X_{solvent} = mole fraction of solvent

$P^{\circ}_{\text{solvent}}$ = Vapor pressure of the pure solvent

10. Dibutyl phthalate, $C_{16}H_{22}O_4$ (mw = 278 g/mol), is an oil sometimes worked into plastic articles to give them softness. It has a negligible vapor pressure ($P = 1$ torr @ 148 °C). What is the vapor pressure at 20.0 °C of a solution of 20.0 g dibutyl phthalate in 50.0 g of octane, C_8H_{18} (mw = 114 g/mol)? The vapor pressure of pure octane at 20.0 °C is 10.5 torr. Circle your answer.
