

## ALE 14. Buffer Solutions

(Reference: 19.1 Silberberg 5<sup>th</sup> edition)

What does a buffer do and how does it do it?

## The Model: Change of pH when Strong Acid or Base is added

	Aqueous Solution	pH of Solution	pH after 0.050 mol HCl is added to 1.0L solution	$\Delta$ pH Change in pH after adding HCl	pH after 0.050 mol NaOH is added to 1.0L solution	$\Delta$ pH Change in pH after adding NaOH
1.	pure H <sub>2</sub> O	7.00	1.30	<b>-5.70</b>	12.70	<b>+5.70</b>
2.	0.20 M NH <sub>4</sub> Cl	4.98	1.30	<b>-3.68</b>	8.77	<b>+3.79</b>
3.	0.20 M NH <sub>3</sub>	11.28	9.73		12.70	
4.	0.12 M NH <sub>4</sub> <sup>+</sup> and 0.08 M NH <sub>3</sub>	9.08	8.50		9.52	
5.	0.10 M NH <sub>4</sub> <sup>+</sup> and 0.10 M NH <sub>3</sub>	9.25	8.77		9.73	
6.	0.08 M NH <sub>4</sub> <sup>+</sup> and 0.12 M NH <sub>3</sub>	9.43	8.99		10.01	
7.	0.20 M H <sub>2</sub> CO <sub>3</sub>	5.69	1.30		7.92	
8.	0.20 M NaHCO <sub>3</sub>	9.83	6.84		12.70	
9.	0.11 M H <sub>2</sub> CO <sub>3</sub> and 0.09 M HCO <sub>3</sub> <sup>-</sup>	6.29	5.78	<b>-0.51</b>	6.75	<b>+0.46</b>
10.	0.10 M H <sub>2</sub> CO <sub>3</sub> and 0.10 M HCO <sub>3</sub> <sup>-</sup>	6.36	5.88	<b>-0.48</b>	6.83	<b>+0.47</b>
11.	0.09 M H <sub>2</sub> CO <sub>3</sub> and 0.11 M HCO <sub>3</sub> <sup>-</sup>	6.46	6.01	<b>-0.45</b>	6.98	<b>+0.52</b>

## Key Questions

- Finish the two columns in the table above for the change in pH when either 0.050 mol of H<sup>+</sup> or 0.050 mol of OH<sup>-</sup> is added to a solution.
- A buffer is a solution that resists or prevents a large change in pH upon the addition of either a strong acid or a strong base. Compare the  $\Delta$ pH when the same amount of H<sup>+</sup> or OH<sup>-</sup> is added to the same volume of each of the solutions. From this information, which of the solutions in the table above are buffers? (Circle the number of each solution in the table above that is a buffer.)
  - Based on the data in the table above, what are the two components of an aqueous buffer solution? (Circle your two choices.)
    - Strong Acid
    - Weak acid
    - The conjugate base of the strong acid
    - The conjugate base of the weak acid

3. How effective a buffer solution is in maintaining the solution's pH when *either* an acid *or* a base is added to it is referred to as the solution's **buffering capacity**. Which of the following types of buffer solutions has the best buffering capacity?
- one with more moles of weak acid than moles of weak base
  - one with equal numbers of moles of weak acid and weak base
  - one with more moles of weak base than moles of weak acid

Explain your answer, drawing upon evidence from the table on page 1. *Hint*: Consider the average  $|\Delta\text{pH}|$  for each solution.

---

### The Model: The Composition of a Buffer

---

In a **buffer solution**, there is both a **weak acid** and the **conjugate weak base of that acid**. The equilibrium within a buffer system is easily represented as eqn 1.

A buffer solution works most efficiently to protect the pH from addition of either a strong acid or the addition of a strong base when it is prepared such that  $[\text{HA}] \approx [\text{A}^-]$ .

#### Key Questions

4. A buffer solution contains a weak acid and the conjugate weak base (represented generically as HA and A<sup>-</sup>, respectively) and hydronium ions, which exist in equilibrium according to eqn 1.
- Suppose a modest amount of strong acid is dissolved in the buffer solution. Use Le Châtelier's Principle to explain what happens to [HA], to [A<sup>-</sup>], and to [H<sup>+</sup>].
  
  - Explain why there is not a drastic change in the solution's pH when a modest amount of strong acid is added to a buffer solution.

- 5 a. Explain why a solution made up of HCl and KCl is not a buffer but a solution made up of HF and KF is.
- b. Yes or No: *Could* a solution made up of HF and KCl *possibly* serve as a buffer? Explain your answer.
- c. Yes or No: *Could* a solution made up of HCl and KF *possibly* serve as a buffer? Explain your answer.

**The Henderson-Hasselbalch equation:** 
$$\text{pH} = \text{p}K_a + \log \frac{[\text{A}^-]}{[\text{HA}]}$$

### Exercises

6. Use the Henderson-Hasselbalch equation to calculate the pH of a buffer solution that is made to have  $0.10 \text{ M NH}_4^+(aq)$  and  $0.10 \text{ M NH}_3(aq)$ . *Hints:* i.) Ignoring the charges of the acid and the base, which species is the weak acid, “HA,” and which species is the conjugate base, “A<sup>-</sup>”? ii.) Look up in your textbook the  $K_a$  of the weak acid or calculate the  $K_a$  from the  $K_b$  of its conjugate base.
7. a. Suppose a buffer is made to have  $0.10 \text{ M NH}_4^+(aq)$  and  $0.10 \text{ M NH}_3(aq)$ . When  $0.050 \text{ mol}$  of HCl is added to  $1.0 \text{ L}$  of that buffer, assuming the present  $\text{NH}_3$  completely converts all of the added strong acid to  $\text{NH}_4^+$ , what do the concentrations of  $\text{NH}_4^+$  and  $\text{NH}_3$  become? *Hint:* Since the buffer solution has a volume of  $1.0 \text{ L}$ , the number of moles and the molarity of a solute are equivalent. Consider the reaction that occurs and the stoichiometry between  $\text{NH}_3$  and  $\text{H}^+$ .

- b. Use the Henderson-Hasselbalch equation to calculate the pH after 0.050 mol of HCl has been added to 1.0 L of a buffer solution that was originally made to have 0.10 M  $\text{NH}_4^+(aq)$  and 0.10 M  $\text{NH}_3(aq)$ .
8. a. If you want to prepare a buffer with a pH of 3.50, explain why you should probably choose HF and NaF to be the solutes rather than  $\text{CH}_3\text{COOH}$  and  $\text{CH}_3\text{COONa}$ . *Hints:* A buffer works most efficiently when  $[\text{A}^-] \approx [\text{HA}]$ . Refer to the table of  $K_a$ 's of weak acids in your textbook. What are the  $K_a$ 's of HF and  $\text{CH}_3\text{COOH}$ ? Which acid has a  $\text{p}K_a$  closest to the desired pH of the buffer?
- b. What is the desired ratio of  $[\text{F}^-]/[\text{HF}]$  so that the prepared buffer solution will have a pH of 3.50?
9. What are the  $[\text{H}_3\text{O}^+]$  and the pH of a benzoate buffer that consists of 0.33 M  $\text{C}_6\text{H}_5\text{COOH}$  (benzoic acid) and 0.28 M  $\text{C}_6\text{H}_5\text{COONa}$  (sodium benzoate)? The  $K_a$  of benzoic acid is  $6.3 \times 10^{-5}$ .
10. What is the buffer-component concentration ratio,  $[\text{CH}_3\text{COO}^-]/[\text{CH}_3\text{COOH}]$ , of a buffer that has a pH of 4.39. The  $K_a$  of acetic acid is  $1.8 \times 10^{-5}$ .
